Fall 2025

## **Preface: What Do We Test?**

To ensure that Patient Not Found works as intended, here is what we test:

### **Basics:**

- **Account Creation**
  - The user must be able to successfully create an account.
- **Login**
  - The user must be able to successfully log into the system with valid credentials.
  - The system must prevent the user from logging in without valid credentials.
- **Logout**
  - The user must be able to log out and be redirected to the landing page.
- **Navigation (ensure that pages are linked properly)**
- **Buttons**
  - All navigation buttons must redirect the user to the respective page the button is for.
  - All interface buttons (ie, login, logout, download) must function the way they were intended.
- **Name and Role Tag**
  - The tag must display the user's first name and last name.
  - The tag must display the user's role.

### **Summary Generation:**

- File Upload
- Text Input
- Summary Generator
- Tabs (For separate multi-summary generation)
- Summary Editor
- Undo Changes function
- Download Functionality (.PDF/.DOC)

### **Admin Functions:**

- Hide/Show Admin Features Based On Role
- Admin Dashboard and Audit Log

### **Input Control:**

- Ensure Valid Credentials Allow User to Login
- Prevent User from Summarizing Input Other than Doctor Notes

## 1. Fake Patient Summaries

**What are Fake Patient Summaries?** - Due to HIPAA restrictions, patient data used to test the system must be completely fictional. Fake Summaries will have:

- A fictional first and last name (ie, can be an existing fictional character like Steve Harrington or SpongeBob SquarePants, or some random made-up name like Nicholas Bathroom)
- Age
- Visit Date
- Explanation of Symptoms
- Past Medical History
- Medications
- Allergies
- Assessment
- Future Patient Plans

Fake Summaries are either uploaded into the system via file upload or pasted into the input box.

## 2. Synthetic Data Stress Tests + Multiple File Uploads

Synthetic Data Stress Tests and Multi-File Uploads are used for:

- Finding the average time it takes to create a new summary
- See if the system is able to accept multiple summaries at the same time.

## 3. Wacky Edge Cases

Wacky Edge Cases are:

- Of various formats, to check whether or not the summarizer can summarize notes in any format other than bullet points.
- May have multiple days listed, to simulate how a patient recovers in a given time period
- May have a patient with a more severe ailment
- May try to throw the AI off using incorrect information, while giving context clues to see if the AI can generate an accurate summary using the context clues

## 4. Error Cases

Error Cases are essentially anything that aren't doctor notes. These include:

- Gibberish pretending to be doctor notes (will have fields of doctor notes, but are filled with nonsense instead of what actually should be in a doctor note)
- Song Lyrics
- Journal Entries from Patrick's Dream Journal
- Incomplete notes, or notes that are missing key fields like patient symptoms.

## **5. Admin Dashboard Access Control**

As the title says, only Administrators can access the Admin Dashboard. This means:

- Other roles cannot have access to the Dashboard.
- The Admin Dashboard will display the Audit Log.

## **6. Session Expiration**

For security reasons, sessions do not last forever. The session must expire when:

- The user logs out of the system and is redirected to the landing page.

---

## **Test Results Summary**

- **Login - Correct Credentials**
  - Result: Pass
  - Notes: User is able to log in with correct and valid email and password
- **Login - Incorrect Credentials**
  - Result: Pass
  - Notes: The system rejects incorrect or invalid credentials, preventing the user from successfully being able to log in.
- **Account Creation**
  - Result: Pass
  - Notes: The user is successfully able to create an account and log in.
- **Password Reset**
  - Result: Pass
  - Notes: The user receives a reset password email and is able to reset their password.
- **Account Settings (Save and Quit)**
  - Result: Fail
  - Notes: Invalid ID error, user is unable to edit account settings
- **Account Settings (Quit Without Saving)**
  - Result: Pass
  - Notes: The user is able to revert changes to their account.
- **Navigation Bar - Name and Role Tag**
  - Result: Pass
  - Notes: The name tag displays the user's first and last name, as well as their role.
- **Summary Generation**
  - Result: Pass
  - Notes: The user is able to generate a summary from a file or pasted text.
- **Summary Download**
  - Result: Pass
  - Notes: Able to download a generated summary as a .PDF, .DOC, or .JSON file.

---

## **Bugs Found and Fixed**

- **Password Check Fail**

- Input: Correct and Valid Username and Password.
- Output: Error 401 Unauthorized. Password matching fails, even when the entered password and account password stored on the server are the same.
- Expected Outcome: Successful Login, creates a new session on Swagger
- Severity: High
- Testers: Patrick and Sam

- **HTML Login Broken**

- Input: Valid and Correct Username and Password
- Output: Incorrect Username or Password. "Cannot read Properties of Null"
- Expected Outcome: Successful Login, redirects to Homepage
- Severity: High
- Tester: Patrick

- **Generator Allows Garbage Input**

- Input: Song Lyrics and Journal Entries from Patrick's Dream Journal
- Output: Summaries of dreams and song lyrics
- Expected Outcome: "Unknown Input Received" Error, Summarizer fails to summarize text
- Severity: Low
- Tester: Patrick

- **Summary Generation Button Broken**

- PHI button only works when the system is in Dev Mode.
- Input: any sample summary
- Expected Output: AI-Generated Summary
- Current Output: Jargon in browser console
- Severity of Bug: High
- Status: Closed

- **Redaction Checker is Too Paranoid**

- Notes: It's triggered when your frontend checks the redacted output and still detects PHI-like patterns (e.g., numbers or capitalized names)
- Input: Partial names, Doctor Name (ie. Dr. Fitzgerald)
- Expected Output: Successfully created AI summary
- Current Output: Aborted summary
- Severity of Bug: High
- Status: Low

- **CSS Being Inconsistent**

- Issue: screwed-up CSS on the account creation and profile editor pages
- Input: N/A
- Output: black buttons for navigation bar alongside the submission buttons for those pages.
- Expected: regular buttons on navigation bar, black buttons for submission.
- Severity: Medium
- Status: Done, Fixed

- **Download Functions on Summary Editor Reloads Page**

- Input: Click both DOC and PDF buttons after editing summary
- Output: After downloading one of the files after editing, the page reloads, automatically erasing any changes and reverting it back to the original AI generated summary
- Expected Output: Allowed to download the PDF and DOCX files without losing changes.
- Severity: High
- Status: Fixed

- **Missing Error Handling on Inputs**

- Input: N/A
- Output: N/A
- Extra Info: Login and Redact pages do not validate input fields before submission. Check the Account Creation page for validation and required fields. Add required attributes and client-side validation (e.g. check empty file or note field).
- Severity: N/A
- Status: Fixed

- **No Responsive Layout**

- Issue: screwed-up CSS causing divs to clip when adjusting the page
- Input: N/A
- Output: divs clipping into the navigation bar when adjusting the page
- Expected: clipping does not occur when adjusting the page
- Severity: Medium
- Status: Done, Fixed

- **Missing Error Handling on Inputs**

- Issue: Login and Redact pages do not validate input fields before submission.
- Input: blank fields without info before pressing submit
- Output: Can submit even with blank fields
- Expected: alert message saying field(s) cannot be blank
- Severity: High
- Status: Done, Fixed

- **Duplicate/Outdated Inline Styles**

- Issue: Some pages have inline <style> or partial overrides conflicting with style.css
- Input: N/A

- Output: Inconsistent styling as a result of pages sharing 4 main CSS files
- Expected: Consistent styling using separate CSS files for each page
- Severity: Low
- Status: Done, Fixed
- **Name and Role Tag messes up Navigation Bar**
- Issue: navigation bar only shows home button when outside homepage, kicks you back to login when pressing the home button.
- Input: N/A
- Output: Settings and Home button missing on navigation bar outside of homepage
- Expected Outcome: settings, home, and name tags show on all pages except when logged out
- Severity: High (affects backtracking to homepage)
- Status: Done/Fixed
- **Audit Log Displays User as System**
- Input: N/A
- Output: Audit Log displays a logged in user as "Username: System"
- Expected Output: (Example: Username: car)
- Severity: Medium
- Status: Fixed
- **File Upload - Multiple Files**
- Multiple files not processed.
- Input: 1-5 files
- Output: 1 summary
- Expected: more than 1 summary
- Severity: High
- Testers: Joanna & Patrick
- Status: Fixed
- **Create Account Cannot Contain Control Characters**
- Input: Standard fill-out of fields (no illegal character injection)
- Output: Unable to create account due to paranoia check
- Expected Outcome: Able to create account (if no illegal characters were pasted into the fields)
- Severity: High (prevents users from creating an account)
- Status: Fixed
