Topics I've Done Background Research On

1. HTML Mockup

While creating the HTML mockup for the project, I thought it would be a good idea to look at past assignments that I've done for other classes to refresh my mind. For the login page, I used my final project for Professor Gormanly's Software Dev 2 class as a base for the UI. I changed the background to solid colors that would fit the project better, and were used in the Canva UI mockup. Later on in the semester, I was tasked to redesign the summary page. I combined an HTML mockup created by Joanna with whatever I had for the old summary page. A toggle switch was added, which was from a System Design assignment. In short, I used whatever I have done in the past to help jog my memory and slowly morph it into the User Interface that we have today.

2. Download Functions

As I believed that code already exists for DOC and PDF file downloading, I decided to search the web for tutorials from creators who have already done them. I have searched through YouTube for tutorials, as well as Reddit and StackOverflow for pre-made code that can be used to implement the download buttons. The code for each download function was modified to hook up to the output box of the Summary Generator. The code was also modified to prevent download buttons from automatically reloading the page when you click each respective download button.

3. Apereo CAS

When the topic of password reset was brought up, we asked Professor Arias for recommendations. To handle the Password Reset and Account Editor logic, he recommended Apereo CAS. When conducting background research with Sam, we found out the two main ways to do it are via Docker (Container) if we were doing it locally, or using Apache Tomcat if we were to host our application on the web. Since this is a local-based project (ie. installed dependencies that run together in the browser), Docker was our only option. Since I have no prior experience with CAS or Docker, my job is to read through the documentation with Sam and try helping him understand what the instructions imply. In the end, Apereo CAS implementation was ultimately scrapped because of a lack of a password reset feature in newer versions. It was ultimately replaced by Auth0.
